Is the right information available before a visit?

Lab results and appointments can sit in separate records. I built a workflow to connect them and check what is available.

933 native FHIR resources across 11 types
Expanded dataset for downstream analytics

Connecting records makes them reviewable

Interoperability Foundation

HL7-to-FHIR transformation with linked patient, laboratory and appointment records.

Cloud Analytics Platform

An AWS S3–Snowflake pipeline with traceable batch ingestion and structured clinical data.

Connected Care Insights

Visibility into patient information coverage and qualifying results ahead of scheduled visits.

Reviewers can see what is available

Coverage analytics show linked patient records. Visit checks explain which results qualify before an appointment.

Building similar platforms?
I’d welcome your perspective, or a conversation about where I could contribute.
